About me

My name is Paolo Guerzoni. I am an architect registered with the Professional Association of Architects of Ferrara since 2009, with experience in the design and delivery of renovation projects.

What I do

In recent years, I have worked on projects involving surveying, modelling, representation and technical development. I use the main CAD software packages and the Adobe suite, as well as Autodesk Revit with a BIM-oriented approach. I have completed professional training as a BIM Specialist and have been applying these skills in practice for around ten years. I also work in architectural visualisation, with a particular focus on the communicative quality of design through images and visual representations.

How I work

My approach begins with identifying the project's key hierarchies in order to define a system of decisions that guides all subsequent phases. I seek effective, functional and well-balanced solutions. I place great importance on the construction phase: I am interested in following its development closely and actively contributing to its management and to the decisions it entails.

Experience

After the 2012 Emilia earthquake, which affected the area where I live, I had the opportunity to work on numerous reconstruction-related projects. This context allowed me to develop cross-disciplinary skills, from design to site management, as well as bureaucratic procedures and the coordination of the different project phases.

Focus

I am particularly interested in the execution and delivery phase of a project: the moment when design engages with the reality of construction. I pay close attention to optimising resources and reducing waste, whether in terms of time, materials or processes, with the aim of making the workflow as efficient as possible.

I am interested in exploring and testing new technical and construction solutions, with a concrete focus on their practical applicability.
